

ABSTRACT

An electric potential therapy apparatus has been prepared with a plurality of alternating current patterns, made by combining varying voltages, waveforms and frequencies with the passage of time. The user selects one from the alternating patterns in accordance with the user's physical constitution and physical condition, so that an a.c. generating circuit (9) generates a high voltage alternating current which changes its voltage, waveform and frequency in accordance with the alternating current pattern, to be applied to an electrode (1). A massage unit (11) having kneading rollers moving up and down is arranged in a backrest (10) of the electric potential therapy apparatus while a roller massager is provided for a footrest (14). Further, an ion generating unit (16) is provided over the backrest (10).
